

Agency Performance Ratings Codebook

“Measuring the Impact of Appointee Vacancies on U.S. Federal Agency Performance”

Mark D. Richardson, Georgetown University

Christopher Piper, Vanderbilt University

David E. Lewis, Vanderbilt University

Data: 07_performance_ratings_all_fmt.d.Rdata

Model estimation details are in Appendixes A and B in the supplementary materials. Details regarding R scripts and Stan models are in the ReadMe file.

Variables

Variable Name	Description
agency	Name of the rated agency
perf_rating_*	Mean of the posterior distribution of latent performance; Larger values indicate higher performance
perf_rating_*_sd	Standard deviation of the posterior distribution of latent performance
perf_rating_*_lb	Lower bound on the 95% Bayesian credible interval
perf_rating_*_ub	Upper bound on the 95% Bayesian credible interval
perf_rating_*_lb_90	Lower bound on the 90% Bayesian credible interval
perf_rating_*_ub_90	Upper bound on the 90% Bayesian credible interval
n_inf_perf_ratings	Number of informed ratings
n_perf_ratings	Number of ratings used to estimate the models
*_inf_hier	Suffix indicates model with informed priors on latent performance and hierarchical priors on the rater parameters
*_nv_hier	Suffix indicates model with naive priors and hierarchical priors on the rater parameters
*_inf	Suffix indicates model with informed priors
*_nv	Suffix indicates model with naive priors
*_pid	Suffix indicates model with indicator variables for appointees, Democrats, and Republicans
*_cmp	Suffix indicates nonpartisan estimates generated using only data in the partisan models to facilitate comparison of partisan and nonpartisan models by ensuring any differences in estimates are due to differences in model specification and not differences in data used
*_dem	Suffix indicates estimates based on assessments of self-reported Democrats including leaners
*_rep	Suffix indicates estimates based on assessments of self-reported Republicans including leaners
*_fxd	Suffix indicates agency estimates were constrained to be the same across parties
*_pty	Suffix indicates model with a party hierarchical rather than a workplace hierarchy
n_pid_perf_ratings	Number of ratings in the models subset to respondents who answered the party identification question
n_dem_ratings_agency	Number of ratings by self-reported Democrats including leaners
n_rep_ratings_agency	Number of ratings by self-reported Republicans including leaners
sig_dif	Indicator value that takes a value of 1 if difference in Democrat and Republican ratings is statistically significant at the 95% confidence level

Variable Name	Description
sig_dif_90	Indicator value that takes a value of 1 if difference in Democrat and Republican ratings is statistically significant at the 90% confidence level

Note: The distribution of latent performance is rescaled to be distributed $N(0, 1)$ after fitting each model to locally identify the estimates.
